

TO THE HELLENIC CHAMBER OF SHIPPING

FloatMast®, the world's first floating TLP mast and **Mediterranean's** first offshore wind platform infrastructure, is now deployed in the **Aegean Sea** at a record of 65 meters of sea depth. It is designed to provide **the best wind measurements** for maximum economic gain for Offshore Wind Parks, both fixed and floating. In addition, it constitutes the first **permanent maritime surveillance mast** for use by the Coast Guards. The innovation has been developed by two leading **Greek SMEs**, namely ETME and STREAMLINED, with the collaboration of CRES (Centre for Renewable Energy Sources, Greece) and the contribution of a significant number of Greek and international entities. The project apart from private and national funding has also received the highest funding in Greece from the European Commission under the scheme of **SME Instrument Phase 2 of Horizon2020**.
